Problem B. Placing Rectangles

Time Limit 2000 ms
Mem Limit 1048576 kB

Problem Statement

For positive integers X and Y, a rectangle in a two-dimensional plane that satisfies the conditions below is said to be **good**.

- Every edge is parallel to the x- or y-axis.
- For every vertex, its x-coordinate is an integer between 0 and X (inclusive), and y-coordinate is an integer between 0 and Y (inclusive).

Determine whether it is possible to place the following three good rectangles without overlapping: a good rectangle of an area at least A, another of an area at least B, and another of an area at least C.

Here, three rectangles are considered to be non-overlapping when the intersection of any two of them has an area of 0.

Constraints

- $1 \leq X, Y \leq 10^9$
- $1 \leq A, B, C \leq 10^{18}$
- All values in input are integers.

Input

Input is given from Standard Input in the following format:

$$X \ Y \ A \ B \ C$$

Output

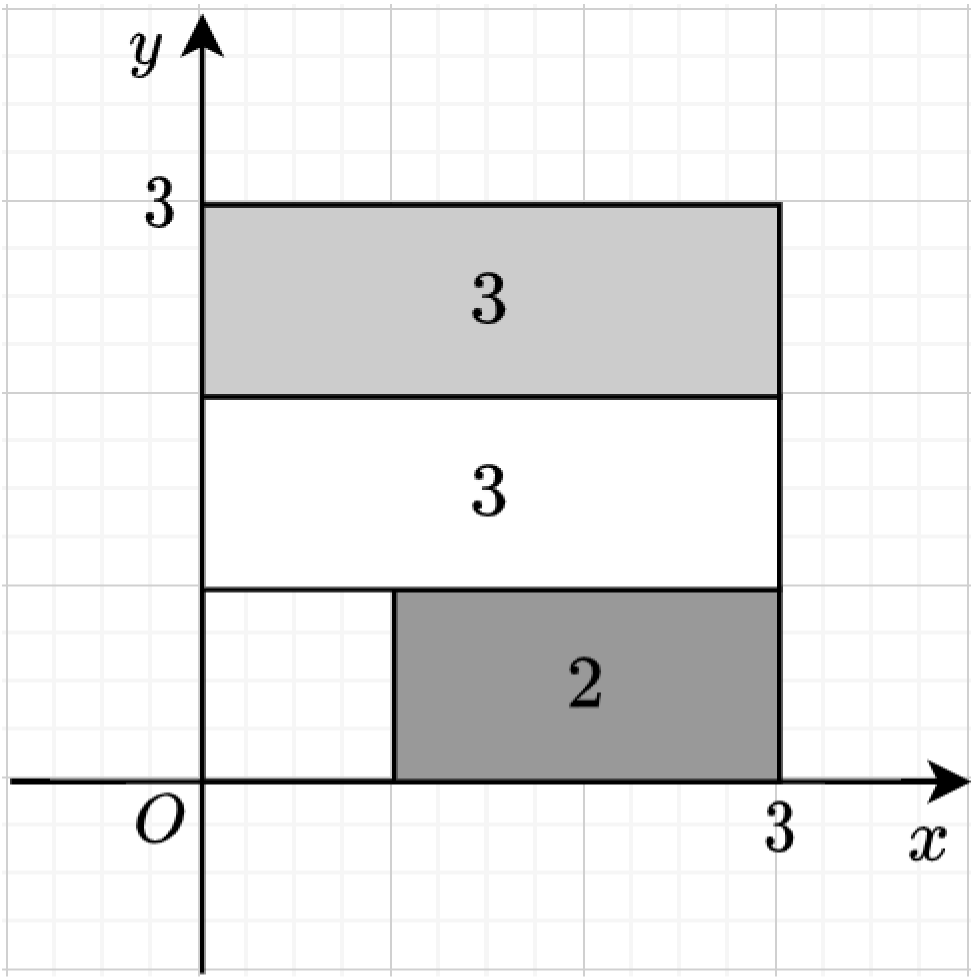
If it is possible to place three rectangles under the conditions specified in the Problem Statement, print `Yes`; otherwise, print `No`.

Sample 1

Input	Output
`3 3 2 2 3`	`Yes`

The figure below shows a possible placement, where the number in a rectangle represents its area.

We can see that $2 \geq A, 3 \geq B, 3 \geq C$, satisfying the conditions.



Sample 2

Input	Output
`3 3 4 4 1`	`No`

There is no possible placement under the conditions.

Sample 3

Input	Output
1000000000 1000000000 1000000000000000000 1000000000000000000 1000000000000000000	No
